PROFILE SUMMARY

Results-driven Technical Leader and Software Developer with 13+ years of experience designing, building, and delivering enterprise applications across Banking, Telecommunications, and Government sectors. Proven track record leading teams and architecting eKYC, NDID, OCR, and core transaction platforms, with deep expertise in microservices, secure financial transaction processing, and AWS cloud deployment.

EDUCATION

Master of Science in Information Technology — Sripatum University

Graduated 2016 · GPA 3.95

Bachelor of Science in Computer Science — Sripatum University

Graduated 2012 · GPA 2.57

SKILLS

Leadership Skills

- Technical Leadership & Mentoring
- System & Solution Architecture
- Microservices Design
- Team Coordination & Code Review
- Agile Methodologies
- Stakeholder & Cross-team Collaboration

Technical Skills

- Java, Spring Boot, Golang, Node.js
- TIBCO Framework, Grails, JSP
- ReactJS, AngularJS, Svelte
- RabbitMQ, Kafka, ActiveMQ
- MSSQL, Oracle, PostgreSQL, MySQL, DynamoDB, Redis
- Docker, Kubernetes
- AWS (Lambda, EKS, ECS, API Gateway, CloudFormation, KMS, Rekognition, SQS/SNS, CodePipeline)

PROFESSIONAL EXPERIENCE

Technical Leader

Thai Credit Bank

Mar 2020 – Present

eKYC Platform

- Designed the eKYC platform end-to-end from a blank slate, covering the customer data model, eKYC transaction/audit logging, and the workflow needed to qualify customers to a given IAL (Identity Assurance Level).
- Designed the face liveness and face recognition pipeline used to authenticate customers against facial biometric data captured during eKYC enrollment at IAL Level 2.3.
- Acted as technical lead, directing a mixed team of junior and senior developers — breaking down architecture into workable tasks, reviewing code, and unblocking the team to keep delivery on schedule.
- Designed and built integrations spanning Core Banking, Counter Service, TRUE SMS Gateway, and DOPA (government ID verification).

- Enabled multi-channel eKYC enrollment: in-branch via Android Tablets and off-branch via Counter Service backend-to-backend exchange.
- Extended the platform's data and trust model to interoperate with the NDID platform for cross-bank identification.

NDID Platform

- Designed as a dedicated, standalone platform separated from eKYC, scoped specifically to NDID (National Digital ID) operations.
- Designed the NDID node architecture (Tendermint, API layer, message queue, secure key/certificate storage) engineered for the bank's AWS Cloud environment.
- Designed an internal application layer in front of the raw NDID API so client teams could integrate without needing blockchain or protocol expertise.
- Designed and developed RP, IdP, and AS/DP services to satisfy business-unit requirements, including transaction reporting and fee calculation logic.

OCR Service

- Designed an in-house OCR service to replace the bank's previous vendor-supplied solution.
- Delivered the first version focused on Thai national ID card OCR, forwarding structured identity data downstream to eKYC and other dependent systems.
- Architected the service with extensibility in mind for future document and image types.

Senior Software Developer

May 2018 – Feb 2020

Saitech Solution (On-site TRUE Corp.)

- Engineered the OMX Mobile Backend, a Java service built on the TIBCO Framework, managing high-volume incoming mobile transactions and consolidating data from multiple upstream systems.
- Consolidated and synchronized distributed data streams from complex legacy systems using Java-based TIBCO Middleware, ensuring zero-loss transaction pipelines through optimized message-queuing and integration interfaces.
- Built a Webtool Application for transaction tracking and JMS message routing, using ReactJS, Spring Boot, Oracle, and Elasticsearch for real-time visibility into transaction status and routing behavior.

Software Developer

Mar 2016 – Apr 2018

PSP (Thailand) (On-site Bank of Ayudhya - BAY)

- Built the DMS (Data Correction) module, enabling authorized operators to audit and modify dataset records in strict compliance with Bank of Thailand (BoT) data correction requirements, using AngularJS, Spring Boot, MSSQL, and iReport.
- Developed a File Management module to manage and organize dataset files used across the system.
- Built a Dataset Dashboard providing a summarized, real-time view of dataset processing status.

Software Developer / Freelance

Oct 2012 – Feb 2016

Pro Technical Info Service

Software Developer — Oct 2012 – May 2015

- Implemented Inventory, Helpdesk, and Knowledge Management modules for the TOT Wi-Fi Provisioning system, using AngularJS, Grails, MySQL, and the Google Maps API.
- Developed the Report and Data Dictionary modules for the Office of the National Anti-Corruption Commission (NACC) Knowledge Management system, using JSP, Oracle, Oracle WebLogic, and iReport.

Freelance Software Developer — Jun 2015 – Feb 2016

- Continued ownership of the TOT Wi-Fi Provisioning system on a freelance basis, implementing new features and maintaining all existing modules.
